

a

Ordinal rankings become allocations only through additional cardinal and feasibility assumptions

Identification boundary: observed acreage does not reveal the feasible set, objective or optimizer selection rule

b Three non-equivalent reversal definitions

Possible	At least one optimizer reverses ranking	Face property
Universal	Every optimizer reverses ranking	Face property
Selected	Reported optimizer reverses ranking	Solver-dependent

c Evidence domains remain separated

Theory	Defines set-valued reversal	PROVED / BOUNDED
Simulation	0/5 convergence rows pass	NONHEADLINE
Empirical	26 states; 77 state-years	DESCRIPTIVE
Mechanism	Acreage optimum / CVaR	NOT IDENTIFIED
